Putter Zoysia.

This grass is ideal for golf course putting greens, bowling greens & home lawns.

Its key benefits are:

- Natural dark green color
- Excellent insect & disease resistance
- Competes against weeds
- Superior traffic & wear tolerance
- Low maintenance (Slow growth = reduced mowing)
- Good drought & salt tolerance

Putter grows best in soils with a pH range of 5.5 – 7.0. Soil levels of 60kg/hectare of phosphorous & 90 – 120kg/hectare potassium will provide a healthy growing plant. Nitrogen applied at 500gms/100m² will provide a healthy growing plant when combined with the recommended phosphorous & potassium.

Putter zoysia grass is a low growing turf that can tolerate low mowing heights with excellent shade / cloud cover tolerance and low nutrient requirement as its outstanding features. It has superb density, brilliant color & due to its slow upright growth, mowing frequencies are reduced which saves you time & money.

Because it is highly adapted, verticutting & topdressing are needed to balance the aggressiveness of this grass once fully established.
